

INSTALLATION GUIDE

Part#: 014448

HARDCORE LIMITED LIFETIME WARRANTY

4.5" Long Arm Suspension System

Jeep Wrangler TJ | 1997-2006

Rev. 060324

491 W. Garfield Ave., Coldwater, MI 49036 • Phone: 517-279-2135

E-mail: tech-bds@ridefox.com

Read And Understand All Instructions And Warnings Prior To Installation Of System And Operation Of Vehicle.

THANK YOU

Your truck is about to be fitted with the best suspension system on the market today. That means you will be driving the baddest looking truck in the neighborhood, and you'll have the warranty to ensure that it stays that way for years to come.

Thank you for choosing BDS Suspension!

BEFORE YOU START

BDS Suspension Co. recommends this system be installed by a professional technician. In addition to these instructions, professional knowledge of disassembly/ reassembly procedures and post installation checks must be known.

FOR YOUR SAFETY

Certain BDS Suspension products are intended to improve off-road performance. Modifying your vehicle for off-road use may result in the vehicle handling differently than a factory equipped vehicle. Extreme care must be used to prevent loss of control or vehicle rollover. Failure to drive your modified vehicle safely may result in serious injury or death. BDS Suspension Co. does not recommend the combined use of suspension lifts, body lifts, or other lifting devices. You should never operate your modified vehicle under the influence of alcohol or drugs. Always drive your modified vehicle at reduced speeds to ensure your ability to control your vehicle under all driving conditions. Always wear your seat belt.

BEFORE INSTALLATION

- Special literature required: OE Service Manual for model/year of vehicle. Refer to manual for proper disassembly/reassembly procedures of OE and related components.
- Adhere to recommendations when replacement fasteners, retainers and keepers are called out in the OE manual.
- Larger rim and tire combinations may increase leverage on suspension, steering, and related components. When selecting combinations larger than OE, consider the additional stress you could be inducing on the OE and related components.
- Post suspension system vehicles may experience drive line vibrations. Angles may require tuning, slider on shaft may require replacement, shafts may need to be lengthened or trued, and U-joints may need to be replaced.
- Secure and properly block vehicle prior to installation of BDS Suspension components. Always wear safety glasses when using power tools.
- If installation is to be performed without a hoist, BDS Suspension Co. recommends rear alterations first.
- Due to payload options and initial ride height variances, the amount of lift is a base figure. Final ride height dimensions may vary in accordance to original vehicle attitude. Always measure the attitude prior to beginning installation.

Visit 560plus.com for more information.

TIRES AND WHEELS

33 x 12.50 on 15-16x8 w/ 3.5" BS

BEFORE YOU DRIVE

Check all fasteners for proper torque. Check to ensure for adequate clearance between all rotating, mobile, fixed, and heated members. Verify clearance between exhaust and brake lines, fuel lines, fuel tank, floor boards and wiring harness. Check steering gear for clearance. Test and inspect brake system.

Perform steering sweep to ensure front brake hoses have adequate slack and do not contact any rotating, mobile or heated members. Inspect rear brake hoses at full extension for adequate slack. Failure to perform hose check/ replacement may result in component failure. Longer replacement hoses, if needed can be purchased from a local parts supplier.

Perform head light check and adjustment.

Re-torque all fasteners after 500 miles. Always inspect fasteners and components during routine servicing.

CONTENTS OF YOUR KIT

014441 (cont.)

Part #	Qty	Description
731	1	Bolt Pack - Upper Control Arm Brackets
	2	10mm-1.50 x 30mm bolt
	6	3/8" USS flat washer
	4	3/8"-16 x 3-1/2" bolt
	4	3/8"-16 prevailing torque nut
	8	3/8" SAE flat washer
	2	3/8"-16 x 1" hex flange head self-tapping bolt
	2	7/16"-14 x 3" bolt
	4	7/16" SAE flat washer
	2	7/16"-14 prevailing torque nut
	2	10mm-1.50 x 90mm bolt
	2	10mm-1.50 prevailing torque nut
732	1	Bolt Pack - Main Control Arm Mount
	4	12mm-1.75 x 50 mm bolt
	4	7/16" USS flat washer
	2	12mm-1.75 x 30mm button head bolt

Coil Springs

Part #	Qty	Description
BDS034451	1	Front Coil Springs
BDS034459	1	Rear Coil Springs

014660

Part #	Qty	Description
A220	4	Front & Rear Lower Control Arm
60107	4	90 degree grease fitting

014448

Part #	Qty	Description
084404R	1	Dropped Pitman Arm
01327	1	Track Bar Bracket
92025	2	Sway Bar Extension
3396	2	Front Bump Stop Extension
2396	2	Rear Bump Stop Extension
22510	2	Front Brake Line
5188	3	Brake Line Clip
B06103C	3	Brake Line L-Bracket

014448		
<i>Part #</i>	<i>Qty</i>	<i>Description</i>
CCW-03-050	4	Brake Line Crush Washer
099000	3	Nylon Cable Tie
22511	1	Rear Brake Line
342701	1	Loctite
54587	1	.750 x .090 x 1.575 Sleeve
SB58BK	4	5/8" ID Hourglass Bushing
45313	4	.625 x .109 x 1.375 Sleeve
01461	2	Rear Shock Bracket
125	1	5/8" x 12mm ID x 1.22" Sleeve
M02888BK	2	Track Bar Bushing
133	1	.625 x .058 x 1.375 Sleeve
01565	1	Weld on Stabilizer Mount
01360	2	Weld on Sway Bar Link Mount
01361	2	Weld on Sway Bar Link Mount
65077	1	Cotter Pin
342701	1	Loctite
A1024	2	JKS Quicker Disconnect
03029	2	Bushing Sleeve
03005	2	Quick Pin
M03212-BK-01	2	Polyurethane Spacer
A1046	2	Stud w/ nut
03014	2	Storage Post
03012	2	Sway Bar Link Clevis
33859	2	3/8 USS washer
23259	2	5/16 x 1-1/2 Socket head bolt
10598-00499	2	M10 X 35MM Button head bolt
10598-01212	2	M10 X 50MM Button head bolt
40167	2	M10 nylock nut
40515	2	M10 external tool lock washer
342702	1	loctite pouch
712	1	Bolt Pack - Shock Brackets
	2	12mm-1.75 x 65mm bolt
	2	12mm-1.75 prevailing torque nut
	4	1/2" SAE flat washer
	2	3/8"-16 x 1" bolt grade 8 bolt
	2	3/8"-16 prevailing torque nut
	4	3/8" SAE flat washer
711	1	Bolt Pack - Rear Track Bar Bracket
	2	5/16"-18 x 1" bolt
	2	5/16-18 prevailing torque nut
	6	5/16" USS washer
	1	3/8"-16 x 1" bolt
	1	3/8"-16 prevailing torque nut
	2	12mm-1.75 x 80mm bolt
	2	12mm-1.75 prevailing torque nut
	3	7/16" USS washer

014448 (cont.)		
709	1	Bolt Pack - Rear Sway Bar Links
	4	10mm-1.50 x 60mm bolt grade 10.9 clear zinc
	4	10mm-1.50 prevailing torque nut clear zinc
	8	3/8" USS flat washer clear zinc
	2	7/16"-14 prevailing torque nut
438	1	Bolt Pack - Bump Stop Extensions
	2	3/8"-16 x 3-1/2" bolt
	2	3/8" USS flat washer
	1	3/8"-16 x 1" self-tapping bolt
917	1	Bolt Pack - Front Track Bar
	2	1/2"-13 x 2-1/2" bolt
	2	1/2"-13 prevailing torque nut
	4	1/2" SAE thru-hardened washer
	1	1/2"-20 nylock nut
	1	12mm flat washer

014441		
<i>Part #</i>	<i>Qty</i>	<i>Description</i>
02590	1	Long Arm Bracket - Drv
02591	1	Long Arm Bracket - Pass
01387B	1	Upper Control Arm Mount - Pass
01388B	1	Upper Control Arm Mount - Drv
A221	2	Front Upper Control Arm Assembly
A222	2	Rear Upper Control Arm Assembly
A116B	1	Front Adjustable Track Bar
15211	6	1/2-13 x 2" bolt
YJTC6	6	Tapered Washer
15211	6	1/2-13 x 2" bolt
W76USS	6	7/16 USS Washer
60107	6	90 degree grease fitting
787	1	Bolt Pack - Control Arms
	4	9/16"-12 x 4" bolt
	4	9/16"-12 prevailing torque nut
	8	9/16" SAE flat washer thru-hardened
	4	7/16"-14 x 3-1/2" bolt
	4	7/16"-14 prevailing torque nut
	8	7/16" SAE flat washer
	2	3/8"-16 x 1-1/4" self-tapping bolt
	2	5/16" USS flat washer
	4	12mm-1.75 x 80mm bolt
	4	12mm-1.75 prevailing torque nut
	8	12mm flat washer

TECH TIPS

TROUBLESHOOTING INFORMATION FOR YOUR VEHICLE

1. A slip yoke eliminator kit and CV style rear drive shaft is required.
2. May require exhaust modification.
3. Some welding required.
4. Long arm systems not designed for long wheel base unlimited models.

INSTALLATION INSTRUCTIONS

INSTALLATION INSTRUCTIONS

SPECIAL TOOLS

PRE-INSTALLATION NOTES

1. These installation instructions are written for an install to be performed on the ground using hydraulic jacks and jack stands. While this is not the preferred/easiest method it is the most common. Ideally this installation should be performed using an appropriate two-post hoist. Using a hoist will allow for the installation to be performed more quickly and easily.
2. This system includes new braided stainless steel brake lines. Installation of these lines requires the entire brake system to be bled following the completed installation and prior to operating the vehicle. Consult your owner's manual for the proper brake fluid to use for your vehicle. Fluid is not included in this kit.
3. This system requires the installation of a slip-yoke eliminator kit and CV style rear drive shaft. BDS offers a slip yoke eliminator kit (BDS #124020) for NP231 equipped vehicles. BDS recommends Tom Wood's Custom Drive Shafts for replacement drive shafts (www.4xshaft.com or 1-877-497-4238)

Reciprocating Saw
Cutoff wheel and Grinding disc
Pitman arm puller
Welder

FRONT INSTALLATION

4. Park the vehicle on a clean, flat surface and block the rear wheels for safety.
5. Disconnect the positive and negative battery cables from the battery.
6. Raise the front of the vehicle and support the frame rails with jack stands just behind the front bumper.
7. Disconnect the rear drive shaft from the axle and transfer case.
8. Remove the 4 transmission mount nuts.
9. Support the transmission/transfer case with a transmission jack. Remove the 6 skid plate bolts and the skid plate from the vehicle.
10. The skid plate must be modified to provide clearance for the new lower control arm mounts. Place the frame mounting surface of the skid plate down.
11. **97-02 Models:**

Part 1: This trimming procedure is to be done on the rear driver's side corner of the skid plate only. (Figure 1)

- A. Measure in toward the center of the skid plate 2" from the center of the rearmost hole and make a cut line perpendicular to the back edge.
- B. Measure forward 3" from the center of the rearmost hole and make a cut line perpendicular to the outside edge. Measure in from the outside edge of the skid plate 5/8" and mark. Make a cut line from the 3" mark parallel to the outer edge at the 5/8" mark all the way to the rear edge (Fig 1).
- C. Measure back from the center of the rear hole 1-3/4" and make a cut line perpendicular with the outside edge.
- D. Make the "L" shaped cut from the rear corner of the skid plate with a reciprocating saw, cut-off wheel and/or plasma cutter. Remove all sharp edges/corners with a grinder and paint all bare metal to prevent corrosion.

FIGURE 1

Part 2: This trimming procedure is to be done on the rear passenger's side corner of the skid plate. (Figure 2)

- A. Make a cut line that is in line with the forward edge of the rearmost hole and perpendicular with the outside edge.
- B. Measure in 5/8" from the outside edge of the skid plate and make a cut line parallel with the outside edge from the rear all the way to the cut line made in step A.
- C. Make the cut from the rear corner of the skid plate with a reciprocating saw, cut-off wheel and/or plasma cutter. Remove all sharp edges/corners with a grinder and paint all bare metal to prevent corrosion.

FIGURE 2

Part 3: Driveshaft Clearance for lifts over 4.5"

- A. Locate the front set of four slotted holes in the bottom of the skid plate. Measure from the center of the front driver's side slot, toward the driver's side 6" and mark. Place the provided cut template so that the corner is located at the 6" mark and the longer edge is flush with the front edge of the skid plate. Using the template as a guide, make a cut line from the driveshaft clearance cut. Make the trapezoid shaped cut from the skid plate with a reciprocating saw, cut-off wheel and/or plasma cutter (Fig 3). Remove all sharp edges/corners with a grinder and paint all bare metal to prevent corrosion. (See template on last page.)

FIGURE 3

12. **03-06 Models:** This trimming procedure is to be done on the rear driver's and passenger's side corners of the skid plate.
- Measure in toward the center of the skid plate 2" from the center of the rear most hole and make a cut line that runs perpendicular to the back edge.
 - Measure forward from the rear most hole 1-1/2" and make a mark perpendicular to the outside ends of the skid pan until it intersects the mark made in step A.
 - Measure forward from the center of the rearmost hole 6-1/4" and make a cut line perpendicular to the outside edge. Measure in from the outer edge of the skid plate 5/8" and mark. Make a cut line from the 6-1/4" mark, parallel to the outer edge at the 5/8" mark until it hits the exiting cut line made in step B (Fig 4).

FIGURE 4

- Make the "L" shaped cut from each of the rear corners of the skid plate with a reciprocating saw, cut-off wheel and/or plasma cutter. Remove all sharp edges/corners with a grinder and paint all bare metal to prevent corrosion.
13. Mount the new provided lower control arm subframes (02590-driv, 02591-pass) to the vehicle using the provided hardware (Fig 5). For 97-02 models use 1/2" x 2" bolts. For 03-06 models use 12mm x 50mm bolts (BP 732). Attach the subframes to the frame rails using the mounting holes that are correct for the model year of vehicle – see figure 5. Snug the hardware so that the subframes are mounted tight to the frame.

FIGURE 5

14. With the subframes properly mounted in position, using the holes in the subframes as a guide, mark the horizontal mounting holes (Fig 6) to be drilled in the frame (4 holes total).

FIGURE 6

15. Remove the subframes and drill 7/16" holes at the marks on the frame. Take care to drill the holes straight (square) to the frame. Drill through both the outer and inner surfaces of the frame. Caution: Check for lines and hoses on the inner frame rail before drilling.
16. When all four horizontal subframe mounting holes are drilled, reinstall the subframes on the frame rails with the provided 7/16" x 3-1/2" bolts, nuts and 7/16" SAE washers (BP 787) through the drilled holes. Leave hardware loose at this time.
17. Install the modified skid plate in the vehicle (Fig 7). Use Loctite on all mounting bolts.
- A. **97-02 models:** Attach the skid plate to the frame using six 1/2" x 2" bolts with the provided 7/16" USS washers followed by the tapered washers (YJTC6). When all the bolts are installed, torque the 1/2" hardware to 65 ft-lbs.
 - B. **03-06 models:** Attach the skid plate to the frame using four 12mm x 50mm bolts and 7/16" USS washers (BP 732). Install a provided 12mm x 30mm button head bolt in the rearmost hole of each subframe. With all the bolts installed, torque the six 12mm bolts to 65 ft-lbs.

FIGURE 7

18. With the skid plate completely installed, go back and torque the four 7/16" horizontal subframe bolts to 40 ft-lbs. Do not over-torque the 7/16" bolts.
19. Lower the transmission/transfer case back on the skid plate by aligning the four transmission mount studs in the skid plate mounting holes. Fasten the mount with the original nuts and torque to 20 ft-lbs.
20. Support the front axle with a hydraulic jack.
21. Remove the wheels.
22. Remove the lower control arms from the axle and the frame. Retain hardware and discard control arms.
23. The front lower control arm pockets must be removed from the frame to provided clearance for the new long lower control arms (Fig 8). Cut the pockets completely off of the frame using a cut-off wheel and/or reciprocating saw. Take special care not to cut into the frame. Grind that area smooth with a medium grit grinding wheel and paint all bare metal to prevent corrosion. The mounts must be removed completely.

FIGURE 8

24. Remove fasteners holding brake line anchors to frame on driver's and passenger's side (Fig 9). Retain bolts.

FIGURE 9

25. Disconnect the rubber brake line from metal hard line.
26. Disconnect brake line from caliper and discard hardware. Ensure old washer is removed from caliper and brake line mounting area.
27. Install new upper brakeline bracket (B06103C) with OE bolt. Leave loose.
28. Mount hard line into new bracket before installing new stainless steel line.
29. Install BDS front brake line (22510) by attaching upper portion first. Tighten fitting securely. Fasten the brake line to the bracket with a new clip (5188). Torque bracket mounting bolt to 20 ft-lbs.
30. Install lower portion with provided new crush washers.

Note: One washer is required on EACH side of the fitting. Brake line must face up after installation. Torque OE banjo bolt to 25 ft-lbs.

31. Disconnect the sway bar end links from the axle and sway bar (Fig 10). The link is fit into the sway bar with a taper that must be released. Use a pickle fork to remove the link from the sway bar. On some models the end link bolt has a serrated shank that is pressed into the mount. The bolt will need to be pressed out.

FIGURE 10

32. Remove OE steering stabilizer from the axle and drag link (Fig 11). Remove the tapered stud from the drag link with a pickle fork or by striking the drag link near the stud with a hammer to free the taper. Discard the stabilizer and hardware.

FIGURE 11

33. Disconnect the steering drag link from the pitman arm (Fig 12). Remove the cotter pin and nut. Use a pickle fork to dislodge the drag link from the pitman arm. Retain castellated mounting nut.
34. Remove the nut and washer mounting the pitman arm to the steering box (Fig 12). Remove the pitman arm from the steering box using an appropriate pitman arm puller. Note the indexing of the pitman arm before removal. Retain mounting nut and washer.

FIGURE 12

35. Install the new provided pitman arm (084404R) on the steering box in the same orientation as the OE was taken off. Fasten with the OE nut and washer. Torque nut to 185 ft-lbs.
36. Disconnect the front shocks from the axle. Retain the lower shock mounting hardware. Leave the shocks attached to the frame at this time as they will be used to help support the axle while installing the new control arms.
37. If equipped, remove the coil spring retaining clips at the axle.
38. Lower the axle and remove the coil springs from the vehicle.
39. Remove the front axle bump stops from the frame (Fig 13).

FIGURE 13

40. Reattach the shocks to the axle with the OE hardware. These will aid in supporting the axle while the new lower arms are installed.
41. Locate (2) pre assembled long lower control arms (A220). Adjust the length to 29-1/4". Install a provided 90° grease zerk (60107) in the flex end so it faces 45° from facing down the arm and towards the outside of the vehicle. The arms are installed with the flex eye at the frame with the bend towards the inside of the vehicle.

 **Tip** *The lower arms are the same front and rear.*

42. Install the new lower control arms in the OE axle bracket with the original hardware and the new subframe pocket with a 9/16" x 4" bolt, nut and 9/16" SAE washers (BP 787). The 90° fitting should be pointing at a 45° angle towards the outside. Leave hardware loose (Fig 14).

 **Tip** *With the shocks and front track bar still attached, just push the axle forward enough to attach the arms to the subframe.*

FIGURE 14

43. Remove the upper control arms from the front axle and frame. Retain the nut tab from the frame mount.

 **Tip** *Be sure that the axle is well supported.*

44. Complete the upper control arm bracket install one side at a time. Loosely install the provided upper control arm drop bracket (01387-pass, 01388-drv) to the OE upper control arm pocket with a 10mm x 35mm bolt, 3/8" USS washer (BP 731) and the OE nut tab. The bracket will run from the outer portion of the OE pocket down to the frame and wrap around to the outside surface of the frame (Fig 15A, B). Adjust the bracket so that it is flush to the bottom and outside surfaces of the frame. Using the bracket as a template, mark the 3 mounting holes to be drilled. Allow the bracket to swing down out of the way.

FIGURE 15A**FIGURE 15B**

45. Drill 3/8" holes at the two marks on the outside surface of the frame. Drill the holes all the way through the frame.

Tip Try to drill as straight as possible (perpendicular to the outside of the frame).

46. Drill a 5/16" hole at the mark on the bottom of the frame, only drilling through the bottom portion (not all the way through).
Note: It may be necessary to disconnect the lower control arms one side at a time to gain drill clearance for the bottom hole.
47. Reposition the bracket to the frame and fasten through the outside 2 holes with 3/8" x 3-1/2" bolts, nuts and 3/8" SAE washers (BP 731). Leave loose.
48. Fasten the bracket to the bottom of the frame with a 3/8" x 1-1/4" self-tapping bolt (BP 731). Apply Loctite to the threads of the self-tapping bolt and torque all mounting hardware to 30 ft-lbs. Torque the 10mm bolt at the OE pocket last. The bracket will reform itself slightly to match the angle of the upper OE bracket.
49. Repeat the upper bracket installation of the opposite side of the vehicle. When positioning the bracket, make a reference dimension from the completed side to aid in locating the hole positions to ensure the brackets are located consistently from side to side.
50. Locate the new front upper control arm assemblies (A221). Install a 10mm x 90mm bolt (BP 731) in the clevis end of each upper control arm. Measure from the center of the clevis (using the bolt to indicate center location) to the center of the eye of the control arm end (Fig 16). Adjust this distance to 17-3/4" (this is a starting point based on 6" of lift). Leave the jam nut loose.

Tip When installed in the vehicle, the grease fitting must be towards the ground. When adjusting the length of the arms, make them mirror images of one another, a driver's side arm and a passenger's side arm (Fig 16).

FIGURE 16

51. Install the new upper control arms in the new upper control arm brackets with 7/16" x 3" bolt, nut and 7/16" SAE washers (BP 731). Attach the arm to the OE front axle mount with the 10mm x 90mm bolt used earlier along with a 10mm nut and 3/8" USS washers (BP 731). Leave control arm hardware loose.
52. Disconnect the track bar from the axle and the frame (Fig 17A, B). Disconnect the track bar from the frame by remove the cotter pin and nut. Strike the track bar mount near the track bar end with a hammer to release the tapered end from the frame mount. Remove and discard the track bar and hardware.

FIGURE 17A

FIGURE 17B

53. Disconnect the shocks from the axle and the frame. Retain the lower hardware and discard the upper hardware and shock.
54. Grease and install the provided extended bump stops (3529) into the OE bump stop cups in the frame.
55. Locate the center of the coil mount on the axle and drill a 5/16" hole (Fig 18). Using one of the provided 3/8" self-tapping bolts, tap the hole and remove the bolt. A lower bump stop extension will be installed here after the coil spring is installed.

FIGURE 18

56. The front sway bar link axle mounts must be cut off to make room for the extended mounts provided. These new mounts will provide proper steering linkage clearance once the vehicle is lifted. Starting on the driver's side, make a cut mark on the axle link mount that is flush with the top surface of the axle coil mount. This mark will be approximately 2-5/8" from the top point of the link mount (Fig 19A, 19B).

FIGURE 19A

FIGURE 19B

57. Cut the link mount along the cut line with a reciprocating saw or cut off wheel. Take care to make the cut as straight and square as possible. The top portion that is cut from the driver's side mount will be used as a template for the passenger's side. Also, making a square cut here will help with setting up the welding process later on.
58. With the driver's side link mount removed, use the cut portion as a template by aligning the hole and the profile of the cut piece with the passenger's side mount. Mark the cut line on the passenger's mount (Fig 20). Note: A 1/2" bolt can be inserted in the mounting holes of the ends to aid in aligning them.

FIGURE 20

59. Cut the passenger's side link on the cut line in the same fashion as the driver's side.
60. With the link mounts cut, go through and remove any corrosion, oil, etc from the remaining portion of the OE link mounts as well as on the top of the OE stabilizer mounting bracket (pass. side). The surfaces must be corrosion/oil free to promote quality welds.

! Caution *A certified welder should perform all welding operations. This step can be skipped until the vehicle is complete and can be driven to a local welding shop if need be. Always keep a fire extinguisher near by when welding. Disconnect both the positive and negative battery cables before welding.*

61. Position a provided new link mount (01360) on the cut surface of the original driver's side mount. The front edge of the new mount should be flush with the front cut edge of the old mount. The inside surface of the link mount should also be flush/parallel with the inside surface of the original mount. Tack weld the new link mount in place (Fig 21A, B). Double check to see that the new mount is square with the original. Note: It is recommended to grind a bevel in the edge of the new link mount (outside where it meets the original mount) to promote good weld penetration of both pieces of material.

FIGURE 21A

FIGURE 21B

62. Repeat the link setup procedure on the passenger's side of the vehicle (Fig 22). With both pieces tacked in place check the relationship between the two mounts to see that they are the same. Measure the inside distance between the tops of the links and the bottoms of the links to see that they are the same (approximately 38-1/2").

FIGURE 22

63. With the links positioned correctly, locate the provided formed side gussets (01361). Position the gussets so that they are parallel to the front surface of the original link mount and flush to the outside surface of the new link mount (Fig 23). Once they are in the desired position, tack weld the gussets in place.

FIGURE 23

64. With the link mount parts correctly in place finish weld the components to the axle. Weld all around the point where the original mount meets the new mounts as well as the full length of the gusset where it meets the new and original link mounts (Fig 24).

Tip Weld the back side of the gusset for best weld penetration and aesthetics.

FIGURE 24

65. Locate the top of the original stabilizer mount on the passenger's side of the axle. Mark from the front edge of the bracket toward the rear $\frac{3}{4}$ " and mark on the top of the bracket (Fig 25). Make a line along the top of the bracket, parallel to the front face at the $\frac{3}{4}$ " marked distance. This will be a reference line for installing the new stabilizer mount/support gusset.

FIGURE 25

66. Position the new provided stabilizer mount (01354) on the top of the original mount so that the hole is to the driver's side and the front surface is aligned to the line marked on the top of the OE bracket (Fig 26). The stabilizer will butt up to the passenger's side link mount that was just installed.

FIGURE 26

67. Check that the stabilizer mount is perpendicular to the top of the OE mount and position against the link mount and tack weld in place. Double check the position and finish weld the mount to the OE bracket and the link mount.
68. With all welding complete allow the brackets to cool and then paint any raw metal to prevent corrosion.
69. The front sway bar disconnects (A1024) come with the bushings installed. Lightly grease and install the provided sleeve (03029) in the sway bar link bushings. Adjust length of sway bar links to 8-3/4", securely lock off jam nut.
70. Install new stainless steel lower sway bar disconnect post with 1/2" nylock nut into the new sway bar link axle mounts. The pin hole should be horizontal with the pins pointing toward the center of the vehicle. Tighten to 65 ft-lbs.

Tip *Note: Apply a drop or spray of lubricant before threading on the nut. (Oil, WD-40, Silicone, or Graphite all work)*

A small phillips head screwdriver or punch inserted into the hole can be used to prevent the pin from rotating.

71. Install the provided upper u-bracket (03012) to the TOP side of the sway bar with the threaded end towards the center of the vehicle. Attach with 10mm x 35mm hardware. Square the bracket up to the frame and tighten to 40 ft-lbs. (Fig 27A)

FIGURE 27A

72. Install the sway bar link assembly to the upper u-bracket with the provided 10mm x 50mm button head bolt with loc-tite on threads and external tooth lock washer. (Fig 27B)

FIGURE 27B

73. Swing the sway bar up and locate an area on the frame rail to install the sway bar link retaining pin that will allow the sway bar to cycle through full motion. Mark center of bushing and drill hole to 17/64" and tap to 5/16"-18. Attach disconnect pin with 5/16-18 x 1-1/2" SHCS with loc-tite on threads. (Fig 28)

FIGURE 28

74. Install disconnect pins into the sway bar studs as shown. (Fig 29)

FIGURE 29

CORRECT

WRONG

75. Lower the axle and install the provided new front coil springs in the vehicle. When installing the coils, insert a 3" bump stop spacer (3396) in the coil before placing it on the axle mount (Fig 30). Fasten the bump stop spacer with a 3/8" x 4" self-tapping bolt and 3/8" USS washer (BP 754). Use Loctite on the bolt threads and torque to 25 ft-lbs.

FIGURE 30

76. Install the new front shocks with the provided upper hardware and OE lower mounting bolts. Torque lower bolts to 20 ft-lbs and upper hardware until the bushings begin to swell.
77. Attach the steering drag link to the pitman arm with the OE nut. Torque nut to 60 ft-lbs and install the new provided cotter pin (BP 754). Do not loosen the nut to install the cotter pin, only tighten.
78. Lightly grease and install the provided bushings (SB58BK) and sleeve (51792) into the steering stabilizer eyes. Install the sleeve in the body end of the cylinder. Install the body end of the stabilizer to the new stabilizer mount on the axle. Fasten the stabilizer with a 1/2" x 2-1/2" button head bolt, nut and 1/2" SAE washer (BP 753). Run the bolt from the back to the front with no washer on the bolt head (Fig 31). Torque bolt to 60 ft-lbs.

FIGURE 31

79. Install the provided new stabilizer stud to the drag link in the existing tapered hole. Tighten the stud hardware securely and secure with the provided cotter pin. Attach the stabilizer to the stud and torque to 35 ft-lbs.
80. Lightly grease and install the provide track bar bushings (M02888RB) and sleeve (51792) in the end of the new front track bar (A148).
81. Install the wheels and lower the vehicle to the ground.
82. Bounce the front of the vehicle to settle the suspension. Ensure that the axle is centered under the vehicle.
83. Lightly grease and install the provide track bar bushings (M02888RB) and sleeve (51792) in the end of the new front track bar assembly (A116).

84. Attach the new track bar assembly to the original steering stabilizer mount so that the track bar runs parallel to the axle to the frame rails. Fasten the bar to the mount with a 1/2" x 2-1/2" bolt, nut and 1/2" SAE washers (BP 917). Leave hardware loose. Bounce the front of the vehicle to settle the suspension. Ensure that the axle is centered under the vehicle.
85. Adjust the track bar end to the appropriate length and attach the end to the OE track bar frame mount with the provided new 1/2" nylock nut and 12mm washer. Torque nut to 55 ft-lbs (an 18mm wrench can be used to hold the end from spinning while the nut is tightened). Be sure the end is square with the frame mount and lock off the jam nut securely (Fig 32).

FIGURE 32

86. Torque the track bar bolt at the axle to 60 ft-lbs.
87. Torque the front upper control arm pivot bolts at the axle and frame to 40 ft-lbs. Ensure the upper control arm flex end is positioned square in the new bracket and lock off the jam nut securely.
88. Torque the front lower control arm bolts at the axle and frame to 95 ft-lbs and lock off the jam nuts.
89. Install the provided coil spring retainers (01379) using the existing holes in the each front coil axle mounts (Fig 33) and 5/16" x 1" self-tapping bolts (BP 754).

FIGURE 33

90. Ensure that the vehicle is sitting level and slide the quicker disconnects over the pins on the axle. Secure with click pins as illustrated in Figure 29.
91. Use provided zip ties to secure the new brake lines away from rotating objects where necessary.

REAR INSTALLATION

1. Block the front wheels.
2. Raise the rear of the vehicle and support the frame rails with jack stands just ahead of the rear bumper.
3. Remove the wheels.
4. Be sure that the axle is well supported. Remove the lower control arms from the axle and the frame. Retain hardware and discard control arms.
5. The rear lower control arm pockets must be removed from the frame to provided clearance for the new long lower control arms. Cut the pockets completely off of the frame using a cut-off wheel and/or reciprocating saw. Take special care not to cut into the frame. Grind that area smooth with a medium grit grinding wheel and paint all bare metal to prevent corrosion.
6. Disconnect the sway bar links from the sway bar and the frame (Fig 34). Discard the links and hardware. Note: If the upper nuts tabs are in good condition they can be reused to install the new sway bar links later.
7. Disconnect the clips retaining the emergency brake cable and rear brake hose to the rear upper control arms (Fig 34).
8. Remove bolt holding the rear brake line to driver's side frame (Fig 34). Retain bolt.

FIGURE 34

9. Disconnect rubber brake line from hard line at retaining clip location.
10. Disconnect the hard lines from brake line junction block on axle.
11. Unbolt the brake line junction block from axle. Retain bolt.
12. Install new BDS rear brake line (22511) in place of the OE. Attach the two hard lines to the junction block and tighten securely. Attach the junction block to the axle with the original bolt. Torque to 20 ft-lbs.
13. Reattach axle breather hose.
14. Attach the new brake line bracket (B06103C) to the driver's side frame with the OE bolt. Torque to 20 ft-lbs. Connect the new brake line to the hard line at the frame through the new bracket. Tighten the fitting securely.
15. Install the new brake line retaining clip (5188).
16. Disconnect track bar from the passenger's side frame mount (Fig 35). Retain hardware.

FIGURE 35

17. Remove the rear shocks. Discard shocks and retain hardware.
18. Carefully lower the axle and remove coils.
19. Locate (2) pre assembled long lower control arms (A220). Adjust the length to 29-1/4". Install a provided 90° grease zerk (60107) in the flex end so it faces 45° from down the arm and towards the outside of the vehicle. The arms are installed with the flex eye at the frame with the bend towards the inside of the vehicle.
20. Adjust the length of the new upper control arms to 25-7/8" (center-to-center). This is a starting point. The length may need to be adjusted at the end of the install for proper driveshaft angles, depending on how the drivetrain is setup.
21. Install the new lower control arms in the OE axle bracket with the original hardware. Swing the arm up to the new subframe pocket and fasten with a 9/16" x 4" bolt and 9/16" SAE washer (BP 787). The grease fitting should up and pointing at a 45 degree angle towards the outside. Leave hardware loose.
22. Remove the OE rear upper control arms from the frame and axle mounts. Retain hardware and discard the control arm. Note: Be sure the axle is well supported.
23. Install the new upper control arm (Flex eye) in the inside subframe pocket (Fig 36) so that the grease zerk is pointing down. Fasten the arm with the 12mm x 80mm bolt (BP 787). Attach the small rubber bushing end of the upper control arm to the OE axle mount with the original hardware. Leave hardware loose.

Note: The emergency brake cable should run below the upper control arm and above the sway bar and lower control arm.

FIGURE 36

24. Remove the plastic cover from the track bar mount on the axle (Fig 37). Discard cover.

FIGURE 37

25. Mark the track bar to indicate which end mounts to the axle and the side that faces rearward to aid installation. Disconnect the track bar from the axle mount (a T-55 Torx socket is required). Remove the track bar from the vehicle. Retain the OE nut tab and discard the bolt.
26. Position the provided track bar relocation bracket up to the OE axle mount. Insert the supplied 1.6" long sleeve in the OE axle mount. Attach the bracket to the axle through the original track bar mounting hole and new sleeve with a 12mm x 80mm bolt, 7/16" USS washer (BP 711) and OE nut tab (if the OE nut tab is damaged use a provided 12mm nut). Snug hardware to hold the bracket in place. (Fig 38)

FIGURE 38

27. Using the new bracket as a template, mark the two additional mounting holes to be drilled. Note: The lowest hole in the bracket will line up with an existing hole that may need to be widened slightly.
28. Remove the bracket and drill 5/16" holes at the top two marks and widen the lower hole, if necessary, to accept the 3/8" bolt.
29. Reinstall the bracket as instructed before in addition to install the provided 5/16" x 1" bolts, nuts and washers (BP 711) in the upper two newly drilled mounting holes and the 3/8" x 1" bolt, nut and washers (BP 711) in the lower hole. Leave hardware loose until all bolts are installed.
30. Torque all mounting bolts: 12mm hardware- 60 ft-lbs, 3/8" hardware- 30 ft-lbs, 5/16" hardware- 15 ft-lbs.
31. Using the location marks made earlier, install the original rear track in the new bracket with a 12mm x 80mm bolt, nut and 7/16" USS washers (BP 711) installed from the rear to the front. Leave hardware loose. Be sure that the passenger's side of the track bar runs above the exhaust. It will be attached the frame with the vehicle on the ground.
32. Locate the OE mounting tabs on the two emergency cables (Fig 39). Using a cut-off wheel, etch the side of the bracket so that it can be easily formed open and removed from the cable. Leaving the cable free at these points will eliminate the chance of binding during extreme suspension articulation. Take care not to cut into the cable.

FIGURE 39

33. Mark the center of the rear coil mounts on the axle (Fig 40). Drill a 5/16" hole in each coil mount. Using a provided 3/8" self-tapping bolt (#438), thread the holes and remove the bolt.

FIGURE 40

34. Install the provided new rear coil springs. Before installing the coils on the lower coil mount, install the provided 3" tall bump stop (2396) in the coil. With the coil in place, fasten the bump stop to the coil mount through drilled/threaded hole made earlier with a 3/8" x 3-1/2" bolt and 3/8" USS washer (BP 438). Torque to 25 ft-lbs. Use Loctite on the bolt threads.
35. Locate the lower shock brackets (01461). These brackets are designed to offset to the outside of the vehicle on both sides for best gas tank and exhaust clearance. Starting with the passengers side, install the bracket so it offsets to the outside of the factory mount (Fig 41A).

FIGURE 41A - PASSENGER SIDE

36. Loosely install the shock relocation bracket in the OE mount to locate the existing hole that lines up with the slot in the new bracket (Fig 41B). Verify the provided 3/8 hardware will fit through the bracket and hole in the axle. If necessary, remove the bracket and drill the factory hole to 7/16".

FIGURE 41B- PASSENGER SIDE

37. Loosely install the relocation bracket to the factory mount with OE shock hardware and provided sleeve (125) through the original shock mounting hole.
38. Attach the bracket with the provided 3/8" hardware (BP712) through the hole in the OE mount and slot in the bracket. Torque to 30 ft-lbs. Figure 3

FIGURE 42A- PASSENGER SIDE

39. Repeat installation on the driver's side, again with the relocation bracket offset to the outside.
40. Install the shocks in the relocation brackets with the provided 12mm bolts, washers, and nuts. (BP712). Torque the factory bolts and new 12mm bolts to 50 ft-lbs.

FIGURE 42B - DRIVER SIDE

41. On the passenger's side, check for clearance between the rear shock and exhaust tail pipe. This clearance varies from vehicle to vehicle and depends heavily on the rotation of the axle, which is dictated by the pinion angle setup. Mark the area if there is a clearance issue (Fig 43). The exhaust can be rerouted or reworked to clear the shock properly.

FIGURE 43

42. Install the provided steel sleeves (45313) in the ends of the sway bar links (92025). Attach the links to the OE frame mount and sway bar using the hardware from bolt pack 709. The OE nut tab for the frame mount can be reused to ease installation (Fig 44). Torque hardware to 30 ft-lbs.

FIGURE 44

43. Install wheels and lower the vehicle to the ground.
44. Bounce the rear of the vehicle to settle the suspension.
45. Torque the rear upper control arm pivot bolts at the axle to 40 ft-lbs. Ensure the upper control arm flex end is positioned square in the new subframe bracket and lock off the jam nut securely.
46. Torque the rear lower control arm pivot bolts at the axle and frame (common upper and lower control arm bolt) to 95 ft-lbs.
47. Connect the track bar to the passenger's side frame bracket with the OE hardware. Torque bolt to 60 ft-lbs.

POST INSTALLATION

1. Completely bleed brake system before driving.
2. Check all hardware for proper torque.
3. Check hardware after 500 miles and any offroad use.
4. Adjust headlights.
5. The control arm ends come pre-greased and therefore are ready for use out of the box. Grease arms after any offroad use and at regular services. Check all control arm/front track bar jam nuts periodically for tightness.
6. A professional front end alignment is recommended to achieve proper steering toe-in and steering wheel alignment. For 98-06 model year vehicles, BDS offers a front alignment cam bolt kit (BDS #124311) for fine tuning alignments if desired. Upper control arm length adjustment will also provide alignment adjustment when necessary.
7. Complete a full steering sweep to check tire clearance with the body, frame and suspension components. Depending on the alignment and tire/wheel combo used, the factory steering stops on each steering knuckle may need to be adjusted.
8. Reconnect the positive and negative battery cables.

WE WANT TO SEE YOUR RIDE!

Grab photos of your BDS-equipped truck in action and send them in for a chance to be featured. Send it in to our Bad Ass Rides customer gallery at bds-suspension.com/bar and post them on the BDS Fan Page on Facebook at facebook.com/BDSSuspensions. Don't forget about your BDS swag! BDS offers t-shirts, hoodies, decals and more available on the BDS website or through your local BDS distributor.

TIME TO HAVE SOME FUN

Thank you for choosing BDS Suspension.

For questions, technical support and warranty issues relating to this BDS Suspension product, please contact your distributor/installer before contacting BDS Suspension directly.
